x: T is read as "expression x is of type T and is in an *r-context*."

x :: T is read as "variable x is of type T and is in an *l-context*."

The operators could also be referred to as the "r-type of" and "l-type of" operators.

l-context denotes everything that is assignable (indicated as a storable memory). r-context, on the other hand, denotes everything that is

There is no r-value (e.g. expression) of the type $\mathcal{B}o\chi(\mathcal{T})$.

For now, we omit rules for *Con* types as they only operate on r-values.

For now, we omit rules for $\mathcal{F}un$ types as they only accept r-values. Any variable and/or primitive type has both r-value and l-value (when it comes to primitive types, only r-value). In all cases, the r-value part of the actual parameter is passed when the function is being called.

The <: and <:: Relations

$$\frac{}{\mathcal{B}o\chi(\mathit{Triv}) < :: \mathcal{B}o\chi(\mathit{Triv})} \tag{13}$$

$$\frac{}{\mathcal{B}o\chi(\mathit{Int}) < :: \mathcal{B}o\chi(\mathit{Int})} \tag{14}$$

$$\frac{T < :: \mathcal{B}o\chi(\mathcal{U})}{T < :: I\mathcal{B}o\chi(\mathcal{U})} \tag{15}$$

$$\frac{\mathcal{B}o\chi(\mathcal{T}) < :: I\mathcal{B}o\chi(\mathcal{U})}{I\mathcal{B}o\chi(\mathcal{T}) < :: I\mathcal{B}o\chi(\mathcal{U})}$$
(16)

$$\frac{T < :: U}{\text{Ref } T <: \text{Ref } U} \tag{17}$$
